Empathy Map Canvas: School IT Support Helpdesk

Date: 03/10/2026	Team ID: 6ab8f707c23107aaaa73276f
Project Name: Auto Ticket Classification using Flow Designer	Maximum Marks: 4 Marks

What does he THINK and FEEL? <i>• what really counts • major preoccupations • worries & aspirations</i> Why do I have to read the exact same Wi-Fi and password tickets every single morning? Worried that tickets submitted before morning bell will miss SLA while sitting in the queue. Feels like manual sorting is a waste of technician time when real IT hardware needs fixing. Wants incoming issues to be tagged and sent to the right resolver right away without manual review. I hope callers get an immediate reply so they stop calling my desk asking if we got their ticket.	What does he SEE? <i>• environment • daily queue • records</i> Dozens of new tickets piling up on the ServiceNow Incident table every morning. Users leaving the Category and Subcategory fields blank or selecting 'Other'. Recurring titles like 'Wi-Fi not connecting in library' or 'Projector won't turn on'. Teachers waiting in classrooms unable to start lessons because AV tickets are stuck in triage. Different technicians tagging the same issue under different categories.
What does he HEAR? <i>• what callers, staff & management say</i> Teacher: "I logged a ticket 20 minutes ago that the projector isn't working, is someone coming?"	What does he SAY and DO? <i>• daily tasks • attitude • public behavior</i> Opens every newly created ticket and reads the Short Description line by line.

Staff: "Did you receive my ticket about resetting my school login password?"	Manually clicks and selects Category (e.g. Network) and Subcategory (e.g. Wi-Fi).
IT Lead: "Why are our monthly category reports so inconsistent across technicians?"	Tells teachers: "Please write clear descriptions so we know what's broken faster."
Colleague: "We spend almost two hours a day just triaging and tagging instead of closing tickets."	Types manual confirmation emails to let teachers know their ticket was received.
Users asking for automatic updates whenever their incident is acknowledged.	Sets up Flow Designer keyword rules so ServiceNow can auto-classify without custom code.

Pain • fears • frustrations • obstacles Spending 15+ hours every week manually opening and tagging routine support requests. Classification mistakes made by tired staff causing tickets to bounce to the wrong team. Morning triage queue jams delaying critical fixes for teachers during first period. Callers repeatedly following up because no confirmation email was sent automatically.	Gain • "wants" / needs • measures of success • obstacles overcome Tickets get classified instantly (< 1 second) when submitted so no queue backlog builds up. Reclaim 15 hours every week to do actual IT maintenance around the school. Caller gets an immediate automated confirmation email with category details. Consistent and accurate reporting across all incidents without human tagging errors.
