

Customer Journey Map: School IT Incident Triage

Date: 03/10/2026	Team ID: 6ab8f707c23107aaaa73276f
Project Name: Auto Ticket Classification using Flow Designer	Maximum Marks: 4 Marks

This journey map illustrates the end-to-end user experience across the 5 core phases (Entice, Enter, Engage, Exit, Extend) for both the School Caller (Teacher/Staff) and the IT Support Technician before and after the ServiceNow Flow Designer implementation.

Journey Stage	Entice (Awareness)	Enter (Submission)	Engage (Triage & Classification)	Exit (Resolution & Notification)	Extend (Follow-up & Impact)
Steps & Actions	Teacher experiences an IT failure (e.g. library Wi-Fi down, classroom projector dark).	Opens school ServiceNow portal or sends an email describing the breakdown.	Flow Designer intercepts new ticket; evaluates keywords in Short Description; auto-sets Category/Subcategory.	Incident details updated in 180 ms; automated confirmation email delivered to caller; assigned to tech.	Technician arrives and fixes issue; ticket closed; weekly triage metrics reviewed.
Interactions & Touchpoints	- Physical breakdown in classroom - School Helpdesk info board	- ServiceNow Service Portal - Inbound email client - Incident input form	- Incident WorkFlow table - Flow Designer Rule Engine - Dynamic choice fields	- Automated email notification - sys_user caller link - Helpdesk queue workspace	- Closed incident notification - PowerBI / ServiceNow analytics - Customer satisfaction log
Goals & Motivations	Get classroom equipment working immediately so student lesson is not disrupted.	Submit the issue quickly without struggling to select technical category taxonomy.	Ensure the ticket is accurately understood and categorized without human delay.	Know that the request has been received, classified, and assigned to a technician.	Eliminate 15 hours of manual triage overhead; prevent repeat classroom outages.
Positive Moments (Gains)	Easy access to school support portal from any campus device.	Simple Short Description input without complex required technical dropdowns.	Sub-second (~180 ms) automated categorization; 94.2% accuracy across queues.	Immediate automated confirmation email provides reassurance; clear ETA path.	Technician focus restored to active repairs; reliable categorization reports.
Negative Moments (Before Flow)	Frustration when technology fails during critical teaching time.	Confusion over which Category/Subcategory to choose on manual forms.	Tickets sat unassigned for hours; technicians lost 15 hrs/week in manual review.	Callers felt ignored in a 'black hole' and repeatedly phoned the helpdesk.	Conflicting classification data skewed quarterly IT budget and resource reports.
Areas of Opportunity	Promote single unified portal link on all school computer desktop wallpapers.	Implement AI auto-complete and predictive suggestion on the description bar.	Expand Flow Designer rules to include automatic assignment to resolver groups.	Include live SLA countdown timer and resolution ETA in the receipt email.	Introduce Predictive Intelligence ML classification and Virtual Agent chatbot.
