

Problem – Solution Fit Template

Date: 03/10/2026	Team ID: 6ab8f707c23107aaaa73276f
Project Name: Auto Ticket Classification using Flow Designer	Maximum Marks: 2 Marks

1. CUSTOMER SEGMENT(S) [CS] Who is your customer? - Primary: School K-12 IT Support Technicians & Helpdesk Staff. - Secondary: Campus Callers (Teachers, faculty, and administrative staff reporting IT failures). - Operational Domain: School Helpdesk handling high ticket volumes across classrooms and computer labs.	6. CUSTOMER CONSTRAINTS [CC] What constraints prevent action or limit solution choices? - Limited IT staff headcount across large campus facilities. - Strict school bell schedule leaving zero tolerance for AV/Wi-Fi downtime during active lectures. - Zero coding budget; heavy preference for native low-code / no-code maintenance.	5. AVAILABLE SOLUTIONS [AS] Which solutions are available? Pros & Cons? - Legacy Manual Triage: Technicians read Short Descriptions line-by-line (Takes 15 hrs/wk; human error prone). - Hardcoded Scripts: Complex JavaScript Business Rules (Brittle, high maintenance overhead). - Unsorted Queues: Allowing callers to pick categories (Over 30% misclassification rate).
2. JOBS-TO-BE-DONE / PROBLEMS [J&P] Which jobs/problems do you address? - Rapidly triage and classify incoming incident tickets upon creation. - Enforce accurate dependent Category and Subcategory field mapping. - Keep callers informed with immediate confirmation receipts. - Minimize triage latency during morning classroom startup rushes.	9. PROBLEM ROOT CAUSE [RC] What is the real reason this problem exists? - Callers lack technical ITSM taxonomy knowledge and leave category fields empty. - Incident intake forms lacked real-time text parsing intelligence on ingest. - Manual ticket handling creates linear human dependencies for every single record.	7. BEHAVIOUR [BE] What does your customer do to address the problem? - Technicians spend the first 2 hours daily reviewing queues and setting fields manually. - Teachers call desk phones or visit the IT office in person when tickets sit unacknowledged. - Staff re-route misclassified tickets back and forth between resolver groups.
3. TRIGGERS [TR] & 4. EMOTIONS [EM] [TR / EM] TRIGGERS: - Sudden AV/network failure during active classroom lectures (projector dark, Wi-Fi lost). - Morning rush ticket surge between 8:00 AM – 9:00 AM. EMOTIONS (BEFORE vs. AFTER): - Before: Overwhelmed, stressed by queue backlogs, frustrated by manual data entry, fearful of missed SLAs. - After: Confident, in control, relieved with instant acknowledgement and 15 weekly triage hours reclaimed.	10. YOUR SOLUTION [SL] & FIT [SL] ServiceNow Flow Designer Auto-Classification: - Zero-Code Flow Designer Engine: Triggers on record creation when Category IS EMPTY. - Instant Keyword Evaluation: Evaluates Short Description for tokens (Wi-Fi, Projector, Password, Slow PC). - Dynamic Field Updates: Populates Category & Subcategory choice values in ~180 ms. - Automated Caller Notification: Dispatches confirmation receipt email to caller dynamically. - Validated Fit: 94.2% classification accuracy; 15 hours triage time reclaimed weekly.	8. CHANNELS OF BEHAVIOUR [CH] 8.1 ONLINE CHANNELS: - ServiceNow Service Portal incident web submission form. - Inbound support email inbox. 8.2 OFFLINE CHANNELS: - Classroom intercom / desk phone calls. - In-person visits to school IT Helpdesk office.
